Education & Certificates

- B.S. in Computer Science from Florida International University — Expected Dec. 2027 | GPA 3.76
- A.A. in Computer Science from Miami Dade College — Graduated Dec. 2024 | GPA 3.81

Work History

Software Engineer Intern at NVIDIA, Santa Clara, CA — *May 2026 to Present*

- Led the testing strategy for NVIDIA GPU Cloud (NGC) web apps in Next.js and TypeScript so new releases stayed reliable for users.
- Created component tests for the dashboards and inventory pages with Vitest and React Testing Library, end-to-end app-flow tests with Playwright, and integration tests confirming the frontend worked with NGC's RESTful API.
- Built a reusable project template with CI/CD built in so any team could launch a new NGC app quickly.

Developer Contributor at CodeCrunch, Miami, FL — *Sept. 2025 to Apr. 2026*

- Redesigned an education platform's website, migrating a HTML, CSS, and JavaScript codebase to Next.js and merging 8 projects into one so it was easier to maintain and scale.
- Built the education platform's backend in Node.js and Express to serve the data and APIs the site runs on, so its features worked reliably for users.
- Built the GitHub Actions CI/CD pipelines that test and deploy the code so releases went out safely with fewer errors.
- Created AI tools powered by OpenAI models that automated research and marketing so non-technical users could use them anytime.
- Led full-stack development with the founder, turning their ideas into working features quickly.

Software Engineer Intern at NVIDIA, Santa Clara, CA — *May 2025 to Aug. 2025*

- Built Bash, Terraform, and Flox automation that set up each app's environment automatically, so engineers could run any of the 14+ apps locally with one command instead of by hand.
- Created preview environments for every app on Kubernetes with the infrastructure team, so engineers could test their changes on a real URL before launch.
- Developed shared Docker and CI/CD environments on AWS so the team built and tested on the same setup, coordinating in daily standups to hit weekly deliverables.

Tech Fellow at CodePath, Miami, FL — *May 2024 to Apr. 2025*

- Led a team of 3 to build Errorly, a React, Node.js, and Railway app where developers get help from other developers, managing Git issues, branches, and code reviews so the team merged code safely.
- Completed 30 weeks of training in data structures, algorithms, and full-stack development, then mentored students for technical interviews.

Advanced Web Dev Team Member at INIT, Miami, FL — *Oct. 2024 to Dec. 2024*

- Built sign-up and login with Google OAuth and email-code verification using FastAPI and a Supabase (Postgres) SQL database so users could create accounts and log in safely.
- Developed Ducky Pics, a full-stack Next.js app, and deployed it to Vercel with a team of 4 in 9 weeks, working together through GitHub.

Projects

CentPoll — Political Polling Platform *2026*

- Built the survey builder and voter outreach over text, voice calls, and the web with Node.js and Twilio so campaigns could reach voters on any channel.
- Developed a live results dashboard with WebSockets, Postgres, and AWS, plus secure per-client logins and Stripe billing, so clients watched results in real time and paid only for completed responses.
- Built AI agents on OpenAI with ElevenLabs voice cloning to automate voice and text outreach so a small team could reach far more people through automated Agentic workflows for political polling.
- Improved the product through weekly pollster feedback and brought on the first customers before launch.

PokerXYZ.io — Multiplayer Web Poker *2026*

- Built the real-time backend in Node.js with WebSockets to handle live game state, chat, rooms, and AI bot opponents so 30+ players always had a table, even when short-handed.
- Created the responsive design in Next.js and Tailwind with custom SVG card and chip art so private games and tournaments worked on any device.

Poker Robot — Card-Dealing Machine *2026*

- Built a Python and Flask server on an NVIDIA Jetson Orin Nano running Ubuntu Linux that connected a Next.js app to an Arduino and used computer vision to track cards, so the robot shuffled and dealt accurately on its own.
- Created a physical robot that shuffled, sorted, and dealt real cards so everyone at the table could focus on the game with no human dealer.

Cozy Soul — Home Rental Site *2025*

- Built location-based listings, search, and posting forms in Next.js and TypeScript with the Google Maps API so travelers could find rentals by area.
- Created sign-up and login with Google OAuth, kept sessions safe with HTTP-only cookies, and added email through Resend so accounts and notifications worked reliably.
- Developed it with a teammate from weekly client feedback so the client could take bookings directly and avoid third-party platform fees.

Theoretical Stock Plays — Stock Simulation Tool *2024*

- Built a Next.js and TypeScript tool that modeled stock plays so users could weigh risk and reward before buying stock assets, made use of Zustand to manage changing simulation state and data.
- Created interactive charts from live Polygon.io API data so users could calculate the risk of a stock purchase with a simulation based on real-time stock prices, used for creating investment strategies.

General Planner — Full-Stack Planner *2023*

- Built and deployed a full-stack MERN planner with Redux and a REST API so users could plan, organize their tasks, and have them persist in our MongoDB NoSQL database for future access.
- Developed it with an MVC structure and role-based access control (RBAC) so each user's tasks stayed private from each other, and admins could manage the app securely.
